

The following is an overview of what was discussed with Dr. Ghonheim and his reactions. In general his feedback was largely positive.

- Said we got a lot further than he ever thought we would
- He was curious about how the motors were tuned through GRBL (the driving units of degrees and mm were used for the mandrel and crossfeed, respectively)
- He liked the overall structure of the machine and was amazed at the tube we produced (albeit the only tube we produced)
- Was curious as to how the issue of resin delivery was addressed (wipers + sheet paper placed under payout eye and mandrel)
- Overall he believes there are good opportunities for a follow on project and is “impressed from the bottom of his heart”
